

A circular phylogenetic tree (circos plot) showing the relationships between various bacterial strains based on their 16S rRNA gene sequences. The tree is organized into several major clades, each represented by a distinct color and branching pattern. The clades include: a large cluster of blue branches on the left side; a cluster of green branches at the top; a cluster of orange branches on the right; a cluster of purple branches at the bottom; and a cluster of red branches on the far right. The branches are labeled with strain identifiers, and the tree is rooted at the top center. The overall structure shows a high degree of genetic diversity among the strains, with some clades being more closely related than others.
